Insurance Platform KPI Framework | Refined

01 Business outcomes and scale

- Primary KPI: issued policy count B01
- Primary KPI: issued-policy premium B02
- Coverage scale: total and policy/policyholder averages B03/B06/B07
- Premium structure: policy/policyholder averages B04/B05
- Submission and receipts: accepted applications B09 / collected premium B08

02 Application funnel and efficiency

- Quote request → valid quote → application transition → accepted submission → issued policy
- Key drivers: step/end-to-end conversion F01/F02
- Non-conversion and duration F03/F04
- Mode comparison: manual/automatic quotation and entry paths F05/F06
- See “03 Business flows” for detailed paths

03 User scale and retention

- New registrations U01
- Active DAU/WAU/MAU U02
- Exact-day D1/D7/D30 retention U03
- Stickiness: average DAU/MAU U04

04 Feature usage

- Key-button clicks/users P01/P02
- Feature adoption and button CTR P03/P04
- Share actions/users P05
- Lookup/search: page-level adoption and results P03/P06

05 User profiles and behavioral preferences

- Platform users: role, channel, organization, region, device
- Policyholders: person/organization, region, purchase frequency, premium band
- Insured parties: person/organization, count or covered-object type; separate from policyholders
- Preferences: pages/paths, lookup/search, issuance mode, sharing
- Product features: insurance line, product, coverage, sum insured, premium, term

06 Experience and service quality

- Failure counts/rate/causes E01/E02/E03
- Contexts: application, online service, identity verification, registration/login
- Online service completion and duration E04/E05
- Guardrails: workflow failure rate E02 and service P90 duration E05
- Consolidate application conversion and paths under the funnel

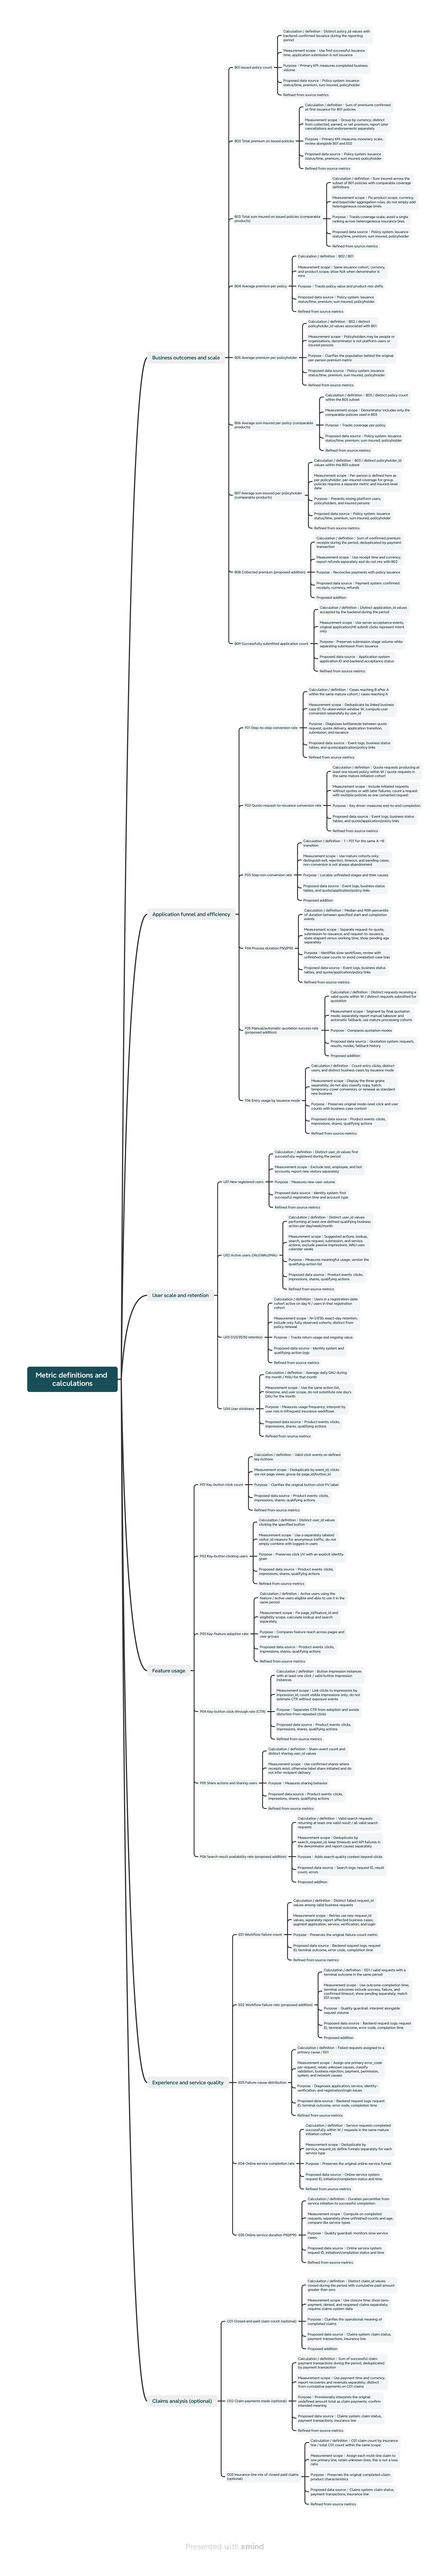

07 Claims analysis (optional)

- Closed and paid claims C01
- Claim payments made C02
- Insurance-line mix of closed paid claims C03
- Provisionally move original undefined transaction scale into claims analysis; confirm intended meaning

08 Segmentation and data governance

- Shared dimensions: time, platform, channel, product, role, mode, organization, region
- Frontend events measure actions; backend states confirm outcomes
- Align IDs, deduplication, currency, timezone, observation windows, freshness
- See “02” for definitions and “04” for conventions and terminology

Business flows and common funnel

Common funnel (proposed state mapping)

- Quote requested → valid quote delivered → application-transition page entered → application accepted → policy issued
- Separate page entry from backend success; buttons labeled quote/issuance or agreement issuance are entry labels
- Track payment branches separately; non-payment-first does not imply waived premium or active coverage
- Allow mode-specific skipped steps; compute conversion only across applicable stages

Issuance modes and entries (source paths preserved)

- R01 Standard new business: direct start
  - Start quote request → enter quote information
  - Preserves standard-product inquiry; merges the empty new-business node into the route category
- R02 Favorite-product quote shortcut
  - Favorite-product quote button → enter quote information
  - Shares downstream flow with R01; record the entry source separately
- R03 Copied quote request
  - Click copy → enter quote information → downstream quotation/application
  - Link the new quote ID to the source ID; downstream mapping is proposed
- R04 “免核” product issuance (internal category)
  - Click quote → dedicated quote-entry page → downstream processing
  - Keep a separate page_id; provisionally interpret as manual-underwriting exemption; confirm automatic underwriting versus full exemption
- R05 Agreement-based issuance: issuance-button entry
  - Search agreement number/name or policy number → click issuance → quote discussion
  - Track separately from R06; confirm the business meaning of agreement
- R06 Agreement-based issuance: record-number entry
  - Search agreement number/name or policy number → click record number → agreement-based issuance
  - Preserve the original route; do not assume the record number is a policy number
- R07 Batch application transition: application-button entry
  - Search quote-request number/policyholder/insured → click apply → application-transition page
  - Record batch_id and child-case IDs; measure batch and child-case success separately
- R08 Batch application transition: quote-number entry
  - Click quote-request number → quote discussion
  - Separate from R07; track downstream steps per child case
- R09 Temporary-cover conversion: product-lookup entry
  - Lookup product/coverage start date → product details → convert → quote entry
  - Link temporary-cover and final policy IDs; avoid double counting in B01
- R10 Temporary-cover conversion: temporary-record entry
  - Search temporary-cover number → convert → quote entry
  - Same business mode as R09; retain distinct entry sources
- R11 Renewal entry
  - Renewal tab → search policy number/insured/policyholder → select product → optional “中断险”/channel details → start quote request → quote entry
  - Retain the internal label “中断险” pending clarification; link original policy and renewal application; do not equate user retention with renewal

713 platform flows (source label retained)

- W01 Original 713 WEB flow
  - Request quote → enter/edit quote information → quote discussion → underwriting and quotation
  - Source ends at quotation; transition, submission, and issuance are proposed additions requiring backend-state mapping
- H01 713 H5: insurance-line path
  - Set/change channel → select insurance line → quote/issuance entry → enter quote information → request quote → manual/automatic quotation → application transition → submit application → payment-first/other application success
  - Add issuance confirmation after the original application-success state; configure payment requirements by payment_mode
- H02 713 H5: agreement path
  - Set/change channel → select agreement → agreement-based issuance → quote discussion → manual/automatic quotation → application transition → submit application → payment-first/other application success
  - Remove the stray final s in the source; record application and issuance success separately

Service and exception paths

- Online service: initiate → input/validate → submit → accept → complete (proposed template)
- Exceptions: validation failure, quotation rejection, payment failure, timeout, exit, cancellation, retry
- When one request produces multiple applications/policies, deduplicate conversion by request and volume by each relevant ID
